Pg. 5 - Section 2: Gathering usernames

Pg. 7 - Section 3: Common Passwords

Pg. 8 - Section 4: How to use EggCrack by Manevolent

Pg. 9 - Section 5: Selling your accounts

Intro

This book is for educational purposes only. I do not condone or encourage any damage you do. By purchasing this e-book you have agreed to my terms of service. Thank you and enjoy the book!

What is Cracking?

Ever wonder how people have *thousands* of Minecraft accounts? The answer is cracking, a simple and efficient way to have a constant flow of accounts. Account cracking is accomplished when you successfully obtain an account's password and have access to said account.

There are many methods of cracking but in this book we will cover dictionary cracking. Dictionary cracking is when you use a list of passwords and a list of usernames in an attempt to find a correct match.

This method will also require a massive list of usernames. Having this will maximize the chance of us having a successful match. We will talk about how to get this username list later.

How it works:

First, we send the first password and first username from our lists to the authentication server and see if we can log in. **If we do**, great, we got the account and move on to the next username. **If we don't** log in we move on to the next password on the list with the same username. We repeat this until we either log in, or the password list runs out.

Software:

Luckily, we don't have to do any of this by ourselves! There is software out there to automate the process of gathering usernames and cracking for us! A download to said software should be provided by the seller.

Gathering Usernames and Common Passwords

Gathering usernames is perhaps the easiest part of cracking. All we are going to do is scrape (gather) the online users list from popular servers.

We will accomplish this with my custom scape client, Emerald Scraper.

Download [here](#). ZIP Pass: EWYW4YbPPy76FEMqVQcU

First, we need to install the client. Go to start and type “%appdata%” (no quotes) and hit enter. You should see this:

Name	Date modified	Type
 .minecraft	8/9/2014 6:59 PM	File folder
 Adobe	1/18/2014 12:54 PM	File folder
 Apple Computer	2/9/2014 4:33 PM	File folder
 Audacity	7/9/2014 10:31 PM	File folder
 Rattle net	4/30/2014 7:44 PM	File folder

Click .minecraft > versions

Then drag the “emeraldscraper” folder into the versions folder.

Now just create a new Minecraft version using emeraldscraper as the version.

We can now scrape usernames! Log in to Minecraft and join a popular server, I’ll be using Mineplex.

Pause the game and click “Emerald Scraper”, you should see this:

The text area is the path where your file will be stored in. Make sure to specify one, or it won't work. If you just write "filename.txt" (without a directory specified) it will be stored in the .minecraft folder, I recommend just storing it there. When you are ready click "Start Scrape", you should get a confirmation that the scrape started in your chat. To double check, look to make sure the word "Scraper" in the top left is green. If it's red, the scraper is off. The scraper gathers the most names when you connect to a server/lobby, so joining all the lobbies on Mineplex will easily get you 1000+ unique names.

Common Passwords

The following passwords are common passwords of Minecraft users:

%user (same as there username, this lets our cracking program know)

minecraft

minecraft123

password

123456

12345678

abc123

qwerty

monkey

letmein

dragon

111111

baseball

iloveyou

trustno1

1234567

sunshine

master

123123

welcome

shadow

ashley

football

jesus

michael

ninja

mustang

password1

pokemon

How to Use EggCrack

Now for the fun part, actually getting accounts. First thing you'll want to do is download EggCrack from [here](#). After that, start up the program. The program is pretty self-explanatory, but I'll try to make it as easy as possible. Note, this is not my program and I take no credit for it

Your username and passwords lists should be loaded here.

Proxies can be loaded here. They aren't required but are HIGHLY recommended. A proxy scraper can be found [here](#).

Your thread count is essentially How many cracks you want going at once. A safe amount is relative to your PC's speed.

Output file is where you want your successful accounts outputted to.

Selling your Accounts

All that's left to do now is sell your accounts! The way you do it is pretty open ended. I would recommend setting up an auto-buy system on a free website builder.

Some good website builders/shops:

www.wix.com

www.weebly.com

www.shopify.com
