## ***INTRODUCTION***

Before I start this method, I'd like to thank you for purchasing this ebook for \$17.95 (without discount). In this guide I will teach you a new method on how to hijack skype accounts. After you hijack them, you'll have complete access over them, and you can do anything you want to do with them. For this method you will have to have the victim added on skype and you'll need to have a tiny bit of trust. Now move on to the next heading in order to learn how to apply this method.

## ***METHOD***

Now I will explain to you how this method works, and how you can do it.

Like I said in the introduction, this method will require you to have the victim added, and it'll help if he/she has the tiniest bit of trust in you.

Now that you know what you need to have in order to execute this method, lets get started.

-----

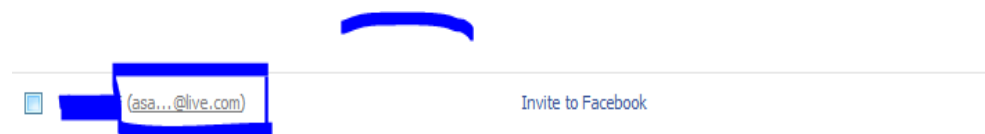

## Getting their Email

First off you want to get their email, so, you want to you have a small conversation with the victim. Just talk about random things such as how their day was, etc. Once you've done that, you want to go to this link: <http://facebook.com/find-friends>

You want to make sure you are logged into Facebook.

When you're on that page, you should see a Skype option. Click it, and enter in your skype credentials in which you used to have a conversation with the victim. Once you've done that, click Enter, and let it authenticate and load your contacts. Once it's done with that, you want to Skip>Skip>No>Skip. Now you should be taken back to the /find-friends page. Go to [https://www.facebook.com/invite\\_history.php](https://www.facebook.com/invite_history.php) and press CTRL+F and search for their Skype Display name. You should find a match, with a portion of their email. Now, click the email and enter the captcha, then the full email of the skype account will be exposed.

(If you don't see the Skype Option then please use different proxy locations until AOL is replaced by skype. )

Now you have 2 paths here. If the email looks fake, then go to the host (in my case live.com) and create the exact same email. If you were able to create it, then go to this link:

[https://login.skype.com/account/password-reset-request?return\\_url=https%3A%2F%2Fsecure.skype.com%2Faccount%2Fmain-page](https://login.skype.com/account/password-reset-request?return_url=https%3A%2F%2Fsecure.skype.com%2Faccount%2Fmain-page)

And reset the password to the email. It should email you with instructions to resetting the password. Once you've reset the password, sign in, and now you've got FULL access to their account.

If the email is real, then you're going to have to trick them into changing their skype email. In order to do this, you have a variety of choices. The more creative you are, the higher chance of success. But I'm going to tell you a basic way that has gotten me over 35 accounts.

Basically, you message them using a template similar to this one:

" I just found your email: <email here> from a recent skype bug. It is highly recommend you

change you skype email to something random, so nobody can get info out of your email (such as ip address, facebook, address, etc). You can do this by going to Skype>Profile>Edit Profile. It is recommended you change it to something like: [abcrandomassemal@outlook.com](mailto:abcrandomassemal@outlook.com). It is required that you use a @hotmail,outlook, or live email and that it is not taken.”

Then if they change it, you just put them into a trap. Now you can go to Hotmail.com and create a real email of the fake email they put on their skype account.

Then go to [https://login.skype.com/account/password-reset-request?return\\_url=https%3A%2F%2Fsecure.skype.com%2Faccount%2Fmain-page](https://login.skype.com/account/password-reset-request?return_url=https%3A%2F%2Fsecure.skype.com%2Faccount%2Fmain-page) and reset the password. Once the password is changed and reset, you’re done with the hijack. Login and do whatever the fuck you want.

=====

If the previous method doesn’t work or gets patched or something, then you can apply this method:

Simply get their skype username and search it on google. Plenty of forum accounts/etc will popup. You’re probably going to have to go on a few sites and find it. I find the email for most of my victims using this method as it’s a lot more ethical and usually can get you better results. Now once you get their email, you want to message the victim on skype telling them to take a security action on their account because their account is vulnerable. Then once they are in your hands, tell them to change their email to something random. Once you’ve gotten to get them to change their email to something random like: [43dsfsadfasfsadf@hotmail.com](mailto:43dsfsadfasfsadf@hotmail.com) go to the email provider and create an email account that’s just like the account. Once it’s done, go here: [https://login.skype.com/account/password-reset-request?return\\_url=https%3A%2F%2Fsecure.skype.com%2Faccount%2Fmain-page](https://login.skype.com/account/password-reset-request?return_url=https%3A%2F%2Fsecure.skype.com%2Faccount%2Fmain-page) and reset the password to the email you just created and in a few seconds, you’ll get an email with a password reset. Reset it, and login.

## CONCLUSION

Thanks a ton for purchasing this ebook, I hope I helped you hijack accounts. If you have any questions or need support in applying this method, I’ll be glad to help you out. My username on Hackforums.Net is Sunlight.
