

I recently met with a pen gun what was manufactured in the former Yugoslavia . That was similar to the shown one , but more difficult to make. I simplified its mechanism and drew it .The original model has replacement barrel for 4mm rimfire , and another attachment for 15mm flare shooting device with blanks.

The biggest advantage of this device , that , an average turner can make it in an hour , except the spring. The material of the gun can be every kind of steel, 'cose the fired cartridge is low powered. If you look the image, you see , that the high level of precision isn't necessary. The parts of the gun must be fit into each other via screw-threads . (The sizes are in millimeter. 25.4mm=1 inch ) The sizes on the image are changeable , but with these the gun operate safely. The firing pin must be rasped from the piston. I do not recommend to use the gun with more powerful cartridges than .22Short , thanks to it's light weight , and "open bolt " . The penguin really comfortable with use of 6mm Flobert (BB Caps)
